-IT FORMALYTIC ACTIVITY: ATP + L-methionine + H(2)O = phosphate + diphosphate + S-adenosyl-L-methionine.

-IT COPACTOR: Binds 2 divalent ions, such as magnesium or cobalt, 1 potassium ion per subunit (By similarity).

-IT PATHRAY: Activated methyl cycle.

-IT SUBUNIT: Homodimer.

-IT TISSUE SPECIFICITY: IN MAMMALIAN TISSUES, THERE ARE THREE DIFORMS OF ADOMET SYNTH. DESIGNATED AS ALPHA, BETA, AND GAMMA. AND BETA ARE EXPRESSED ONLY IN ADULT LIVER, WHILE GAMMA IS WISTRIBUTED IN EXTRAHERATIC TISSUES.
                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                     METHIONINE AND ATP.

CAPTALYTIC ACTIVITY: ATP + L-methionine + H(2)0 = diphosphate + S-adenosyl-L-methionine.

COFACTOR: Binds 2 divalent ions, such as magnesiu 1 potassium ion per subunit (By similarity).

PATHWAY: Activated methyl cycle.
                                                                                                                                                                                                                                                                                                                                  SIMILARITY: BELONGS TO THE ADOMET SYNTHETASE FAMILY.

                                                             -!- CATALUTIC ACTIVITY: ATP + 1-methionine + H(2)O = phosphate +
diphosphate + S-adenosyl-1-methionine.
-!- COPACTOR: Binds 2 divalent ions, such as magnesium or cobalt, and
l pocassium ion per subunit (By similarity).
-!- PATHWAY: Activated methyl cycle.
-!- SUBUNIT: Homodiner.
-!- PATHWAY: ACTIVITY: IN MAMWALIAN TISSUES, THERE ARE THREE DISTINCT FORMS OF ADOMST SYNTH. DESIGNATED AS ALPHA, BETA, AND GAMMA. ALPHA AND BETA ARE EXPRESSED ONLY IN ADULT LIVER, WHILE GAMMA IS WIDELY DISTRIBUTED IN EXTRAHEPATIC TISSUES. IN ADDITION THE GAMMA FORM PREDOMINANTLY EXISTS IN FETAL RAT LIVER AND IS PROGRESSIVELY REPLACED BY THE ALPHA AND BETA FORMS DURING DEVELOPMENT.
-!- SIMILARITY: BELONGS TO THE ADOMST SYNTHETASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               METK RAT

                                                                                                                                                                                                                                                                                                                                     mitted (NOV-1995) to the EMBL/GenBank/DDBJ databases.

FUNCTION: CATALYZES THE FORMATION OF S-ADENOSYLMETHIONINE FROM METHIONINE AND ATP (BY SIMILARITY).

CATALYTIC ACTIVITY: ATP + L-methionine + H(2)O = phosphate + diphosphate + S-adenosyl-L-methionine.

COPACTOR: Binds 2 divalent ions, such as magnesium or cobalt, copperated in the persubunit (By similarity).

PATHMAY: Activated methyl cycle.
                                                                                                                                                                                                                                                                                                          SIMILARITY: BELONGS TO THE ADOMET SYNTHETASE FAMILY.

Such antibodies and their derivatives (including those that comprise the present CDR3 peptide) have Factor VIIIA (FVIIIa) coffactor activity or FIXA activating activity. Administration of the antibodies or their FIXA, even in the presence of FVIIIA inhibitors. This allows for rapid blood cognilation even in the absence of FVIII or FVIIIA, and in the case of FVIII inhibitor patients. The antibodies or their derivatives are used in a claimed pharmaceutical composition for treating patients with blood cognilation disorders, especially haemophilia A and haemorrhagic diathesis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    닭
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of a single chain Fv (scFv) derivative of antibody 193/AD3, comprising the heavy (VH) and light (VL) chain variable regions of 193/AD3 joined by an artificial, flexible linker peptide. The scFv was obtained by PCR amplification of cDNAs for 193/AD3 VH and VL regions and cloning in vector DAP2. 193/AD3 is an example of anti-human Factor IX (FIX)/activated Factor IX (FIXa) and their derivatives, cincluding scFv and CDR3 fragments, have Factor VIIIa (FVIIIa) cofactor activity or FIXa activating activity. Administration leads to an increase in the proceagulant activity of FIXa, even in the presence of FVIIIa inhibitors. This allows for rapid blood coagulation even inhibitor patients. The antibodies and derivatives are used in a claimed pharmaceutical composition for treating patients with blood coagulation disorders, especially haemophilia A and haemorrhagic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3 (CDR3) of the heavy chain of an antibody expressed by mouse anti-ractivated Factor IX (FIXA) activity. It is an example of anti-FIX/FIXA antibodies of the invention. Such antibodies and their derivatives (including those that comprise the present CDR3 peptide) have Factor VIIIa (FVIIIa) cofactor activity or FIXA activating activity. Administration of the antibodies or their derivating activity. Administration of the antibodies or their derivating activity. Administration of the antibodies or their derivatives leads to an increase in the procoagulant activity of FIXA, even in the presence of FVIII inhibitors. This allows for rapid blood coagulation even in the absence of FVIII or FVIIIA, and in the case of FVIII inhibitor patients. The antibodies or their derivatives are used in a claimed pharmaceutical composition for treating patients with blood coagulation disorders, especially haemophilia A and haemorrhagic diathesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                       Feng P,
        New isolated polynucleotides and encoded polypeptides - used to develop products for treating e.g. inflammatory diseases, infections, immunological disorders, autoimmune diseases, allergences.
                                                                       WPI; 1998-414099/35.

The products of the clone can be used for treating conditions associated with abnormal expression of the polypeptides. They can be used for e.g. treating chronic inflammatory diseases, immunological disorders, autoimmune diseases, inflammatory diseases, the largies, and as anti-infectious agents. The products can also be used for detection and diagnosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotraxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence represents one of the novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated protein that is one of 186 human secreted proteins, given in the specification, encoded by one of 309 cDNA sequences also given in the specification. The protein is used in a pharmaceutical composition used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. Dismans, mice, rabbits, goats, horses cats, dogs, chickens or sheep. Dismans which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders
                                                                                                                          Virucide; human; immunopolypeptide; immunopeptide; envelope glycoprotein; nonstructural protein; hepatitis C virus; HCV; E2 glycoprotein; NS3 protein; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Endress GA,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to human immunopolypeptides, produced by a phage transfected cell library. The present sequence is one such immunopolypeptide. The immunopolypeptides have binding specificty for envelope glycoprotein E2 and nonstructural protein NS3 of hepatitis C virus (HCV). E2 glycoprotein is believed to be responsible for target cell binding and contains neutralising epitopes, while NS3 is thought to be involved in the replication of HCV. The immunopolypeptides are useful for diagnosing and treating a patient having or suspected to be having
                                                                                                                                                                                                                                                                                                               Mycobacterium tuberculosis; attenuated microorganism; fad26; Rv2930; signature tagged transposon mutant; mutant library; mycobacterial infection; actinomycetales; antibacterial; immunostimulant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human immunopolypeptide with binding specificity for certain envelope glycoproteins and nonstructural proteins of hepatitis C (HCV), for diagnosing or treating patients having or suspected of
   Screening a mutant library for conditions and for identifying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        identifying and isolating mutants of actinomycetales and for identifying compounds that have antibiotic activity. The method is used to identify mutants of microorganisms, preferably an actinomycetales, such as M. tuberculosis, M. bovis, M. leprae, M. avium, M. intracellulaire and M. paratuberculosis, that is unable to grow under specific conditions. It is especially useful for identifying loci involved in pathogenicity. It is useful in constructing vaccines. The method can be used to screen multiple libraries concurrently. It can screen libraries of different organisms or different strains of the same organism. The present protein is encoded by a gene which is disrupted by the insertion of the IS 1096 transposon to produce an attenuated mutant of Mycobacterium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   library with insertions in genes and/or regulatory regions of the organisms of interest, where the insertion contains a tag and/or a transposon associated with a tag. The mutants are identified by hybridisation of the tags to known sequences. The method is useful treating an individual suffering from a mycobacterial infection, suspected of being infected with a Mycobacterium, or having been exposed to an infectious Mycobacterium. It is also useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                          The invention relates to a human monoclomal antibody or its antigen binding fragments, which exhibit immunological binding affinity for a hepatitis C virus (HCV) El antigen, comprising an amino acid sequence homologous to the binding portion of a human antibody Fab molecule from a combinatorial antibody library. The vaccine composition comprising the antibodies or antigen binding fragments against HCV El or E2 antigen or its hypervariable region is useful in treating or preventing HCV infection in a subject. Sequences ABG76513-ABG76568 represent human monoclonal antibodies against HCV El antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from prosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins
                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vaccine comprising a human monoclonal antibody against hepatitis C virus (HCV) E1 or E2 antigen, useful for treating or preventing HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; HCV; hepatitis C virus; El antigen; monoclonal antibody; vaccine; hepatotropic; Fab; hypervariable region; E2 antigen; antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; Page 56; 64pp; English

                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                        The present invention relates to human immunopolypeptides, produced by a phage transfected cell library. The present sequence is one such immunopolypeptide. The immunopolypeptides have binding specificty for envelope glycoprotein E2 and nonstructural protein NS3 of hepatitis C virus (HCV). E2 glycoprotein is believed to be responsible for target cell binding and contains neutralising epicopes, while NS3 is thought to be involved in the replication of HCV. The immunopolypeptides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                  New human immunopolypeptide with binding specificity for certain envelope glycoproteins and nonstructural proteins of hepatitis C (HCV), for diagnosism or treating patients having or suspected of having HCV infection -

The activity of polynucleotides of the invention may be described as, vulnerary, neuroprotective, immunomodulator, cytostatic and anti-inflammatory. Compositions comprising nucleic acids of the invention are useful for treating a mammalian subject, or as mutritional sources or supplements. These are useful in gene therapy, particularly for treating wounds, burns or ulcers, Alzheimer's disease, Huntington's disease, wounds, burns or ulcers, Alzheimer's disease, Huntington's disease,

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGITG-ABLIGIT), expressed DNA sequences (ABLIGITG-ABLIGIT), expressed DNA sequences (ABLIGITG-ABLIGIT).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and growth of Candida albicans. The C. albicans nucleic acid molecules encoding the polypeptides of the invention may be used as probes and primers for detecting homologous nucleic acid molecule sequences. The polypeptides and nucleic acid molecules and compounds identified as selectively modulating the expression of the polypeptides, may be used as medicaments or for the preparation of a medicament to treat C.albicans associated diseases, especially in AIDS patients and to treat vulvovaginitis in otherwise healthy females. The use of the polypeptides and polynucleotide sequences to treat C.albicans associated diseases has fewer side effects and less toxicity than previously used methods such as the use of amphotericin. This method is therefore especially suitable for
                                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess responsible for genetic disorders or other traits.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              *8888888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to isolated polynucleotide (I) and C polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags CC polynucleotides are also used in diagnostics as expressed sequence tags CC in restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful in gene therapy techniques CC (II). (II) is useful in sequence tags in the sequence of the sequence in the sequence as molecular weight markers and as CC another tating apolypeptide in tissue, as molecular weight markers and as CC imaging of sites expressing (II). (I) and (II) are useful for treating CC imaging of sites expressing (II). (I) and (II) are useful for treating CC imaging of sites expressing (II). (I) and (II) are useful for treating CC imaging of sites expressing (II). (I) and (II) are useful for treating CC imaging of sites expressing (II). (I) and (II) are useful for treating CC imaging of sites expressing (II). (I) and (II) are useful for treating CC imaging of sites expressing (II). (I) and (II) are useful for treating CC imaging of sites expressing (II). (I) and (II) are useful for treating CC imaging of sites expressing (II). (II) and (II) are useful for treating CC imaging of sites expressing (II). (II) and (II) are useful for treating CC imaging of sites expressing (II). (II) and (II) are useful for treating CC independent on DNA and consiste for generate disconting the printed CC in the product sequence of the invention.

CC diagnostic amino acid sequences of the invention.

CC diagnostic amino acid sequences of the invention.
